ABSTRACT

A data organizer, optimizing, reconciliation system (DOORS)/method/program, provides capability to merge intuitively datasets created over users' digital lifetimes from multiple devices. Finds and gathers files from devices and may create master copies in Cloud or local storage.

Enhanced functionality via artificial intelligence or machine learning provides more intuitive merging of datasets including file and folder name selection and may operate autonomously at times of low usage. Optimized by learning from training data, or legacy data, or learning in real time from user preferences, practices, and habits. Reducing loses of treasured photographs and important documents via preventing files getting marooned on inaccessible legacy devices. Because devices get lost, replaced, or may suffer ransomware attacks or may need to be re-set and suffer data loss for a variety of reasons. Compatible and useable across the proliferating number of data producing devices, including smart phones, tablets, cameras, and computers.
